How can I help?

The Nokia Asha platform is an evolution of [Series 40](#) with a brand new UI and a number of new APIs. While most Series 40 articles will work just fine on Nokia Asha we'd appreciate help with the following:

- New articles showing how to use the new Nokia specific APIs for: notification, file selection, image scaling, network state, contacts, phone settings, and also the Mobile Internationalization API (JSR-238)
- Validate older articles against the new SDK and Nokia 501 - then updating the ArticleMetaData and categories to include the new platform and version.
