How to get GPS position with WRT

How to get the GPS position

In S60 5th edition, the developer can get the GPS position using WRT API. This code snippet illustrates how to do this.

```
var so;

try {
    //Retrieves the Service object to the ILocation interface
    so = device.getServiceObject("Service.Location", "ILocation");
} catch (e) {
    alert(' ' +e);
}

// Gets the GPS position
function getLocationAsync() {
    // This specifies update option used while retrieving location estimation.
    var updateoptions = new Object();
    // Setting PartialUpdates to 'FALSE' ensures that user get atleast
    // BasicLocationInformation (Longitude, Lattitude, and Altitude.) is the default
when no LocationInformationClass criteria is given.
    updateoptions.PartialUpdates = false;

    var criteria = new Object();

    criteria.Updateoptions = updateoptions;

    try {
    //Executes the GetLocation method and sets the callbackLocation as the callback
function to be called.
    so.ILocation.GetLocation(criteria,callbackLocation);
    } catch (e) {
        alert ("getLocationAsync: " + e);
    }
}

//Callback function that receives the result as parameter.
function callbackLocation(transId, eventCode, result){
    var latitude = result.ReturnValue.Latitude;
    var longitude = result.ReturnValue.Longitude;
}
```

An example using the device position

The developer can use the latitude and longitude to render a map with the device position. In this article it was shown how the user can develop a new UI component and a Map component was shown as an example.

The developer can send the latitude and longitude retrieved from the WRT API and render a static map with the device position using this post. The code is shown below.

```
var so;
```

```
var uiManager;

var mapControl;

// Gets the GPS position
function getLocationAsync() {
    try {
        //Retrieves the Service object to the ILocation interface
        so = device.getServiceObject("Service.Location", "ILocation");
    } catch (e) {
        alert(' ' +e);
    }
    // This specifies update option used while retrieving location estimation.
    var updateoptions = new Object();
    // Setting PartialUpdates to 'FALSE' ensures that user get atleast
    // BasicLocationInformation (Longitude, Lattitude, and Altitude.) is the default
when no LocationInformationClass criteria is given.
    updateoptions.PartialUpdates = false;

    var criteria = new Object();

    criteria.Updateoptions = updateoptions;

    try {
    //Executes the GetLocation method and sets the callbackLocation as the callback
function to be called.
    so.ILocation.GetLocation(criteria,callbackLocation);
    } catch (e) {
        alert ("getLocationAsync: " + e);
    }
}

//Callback function that receives the result as parameter.
function callbackLocation(transId, eventCode, result){
    var latitude = result.ReturnValue.Latitude;
    var longitude = result.ReturnValue.Longitude;
    if(latitude != null && longitude != null){
        mapControl.setCenter(latitude,longitude);
        mapControl.reloadMap("You're Here!");
    }
}

function loadLatLng(event){
    getLocationAsync();
}

function setup(){
    uiManager = new UIManager();
    var listView = new ListView(null, "List");
    var renderMapBTN = new FormButton(null, "Render map");
    renderMapBTN.addEventListener("ActionPerformed",loadLatLng);

    mapControl = new Map("Map","",null,null);
    listView.addControl(renderMapBTN);
```
