

Archived:Calendar example in Qt for Maemo

Archived: This article is **archived** because it is not considered relevant for third-party developers creating commercial solutions today. If you think this article is still relevant, let us know by adding the template `{{ReviewForRemovalFromArchive|user=~~~~|write your reason here}}`.

Developers should instead use the Qt Mobility [Organizer](#) API.

Archived: This example demonstrates how to use the Maemo 5 Calendar backend library to manage calendars and events from a Qt application. This library provides a C++ API to create a calendar and add events, birthdays, a journal, or to-do's, including attendees and organisers. Note that in future, Qt Mobility API is expected to be an alternative way to access calendar data.

For further documentation on the implementation of the example, see the [Qt for Maemo Developer's Guide](#).

Download the example application: [File:Qt for Maemo Calendar Example.zip](#).
