Reasons: hamishwillee (15 Aug 2011)

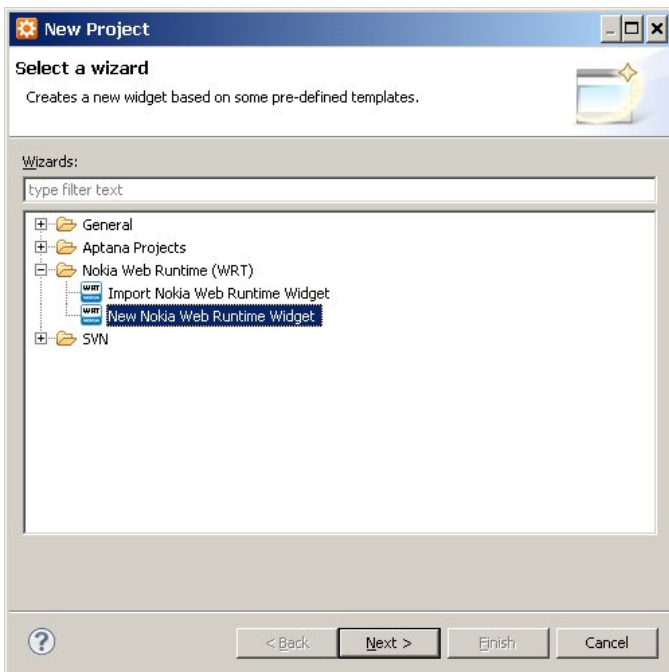

This is based on Aptana IDE, which has been superseded by [Nokia Web Tools](#). This is a useful topic but should be updated to use recommended tools.

In this article we'll show how to create and test the "HelloWRT" widget in Aptana Studio 1.5 with Nokia WRT Plug-in. You can use the same files created in article [Create your first WRT widget](#). After you have installed the Aptana Studio and Nokia WRT Plug-in as instructed in [Web Runtime Tools](#) at Nokia Developer, do the following:

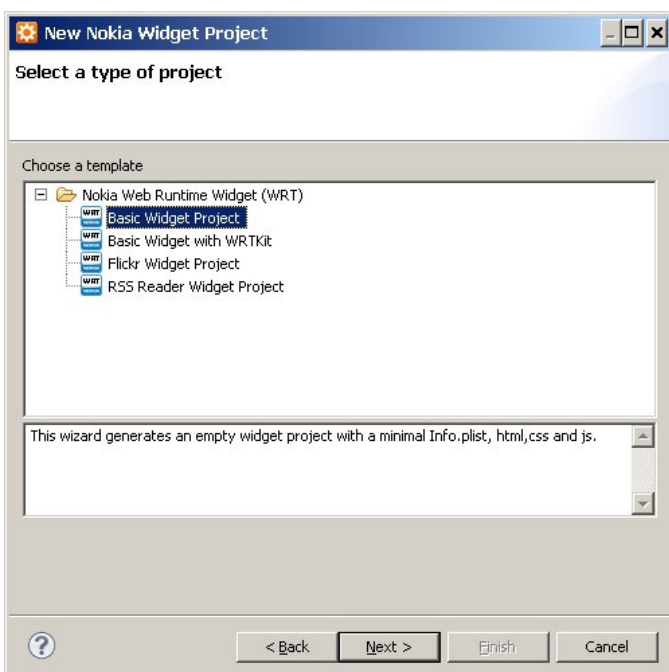

- Select File > New > Project.
- Under Nokia Web Runtime (WRT) select New Nokia Web Runtime Widget and click Next.

28 Feb
2010

- Select Basic Widget Project and click Next.

- Provide a name for the project and choose a location if you don't want to use the default location.

New Basic Widget Project

New Nokia Widget Project

Create a new Nokia widget project

Project Name: HelloWRTWorld

☐ Use default location

Location: C:\tmp\WRT Browse...

< Back Next > Finish Cancel

- Specify a name and an identifier for the widget, or use defaults. You can leave Enable HomeScreen unselected for this widget. If it is selected, it means that the widget should have a static part to be shown on the home screen of the device. Because this example "HelloWRT" widget does not have such a part, this option can be left unchecked.

New Basic Widget Project

New Nokia Widget Project

Create a new Nokia widget project

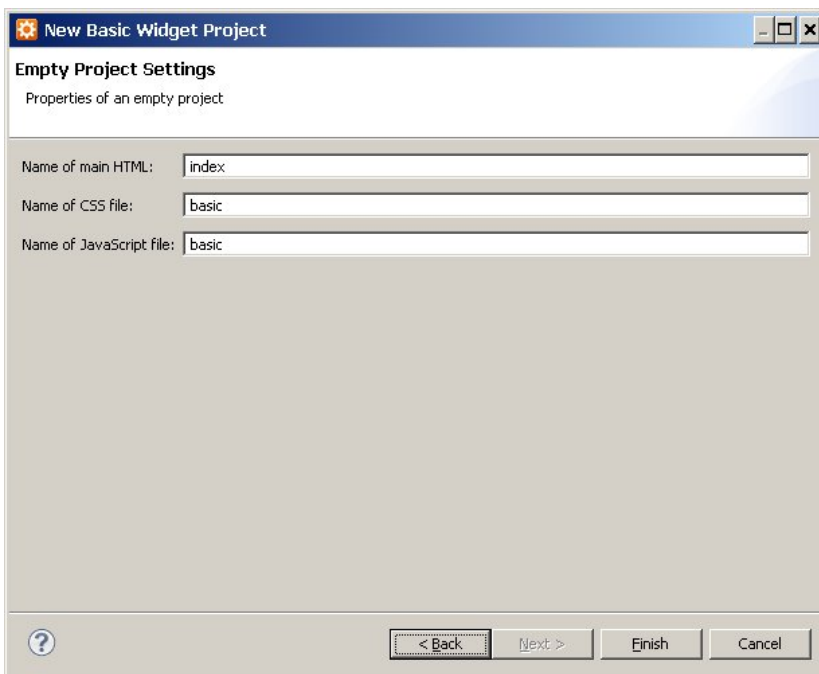

Widget name: HelloWRTWorld
This will be the widget's display name on the device.

Widget identifier: com.HelloWRTWorld.basic.widget
This ID should be unique for successful installation of widget on the device.

☐ Enable HomeScreen

< Back Next > Finish Cancel

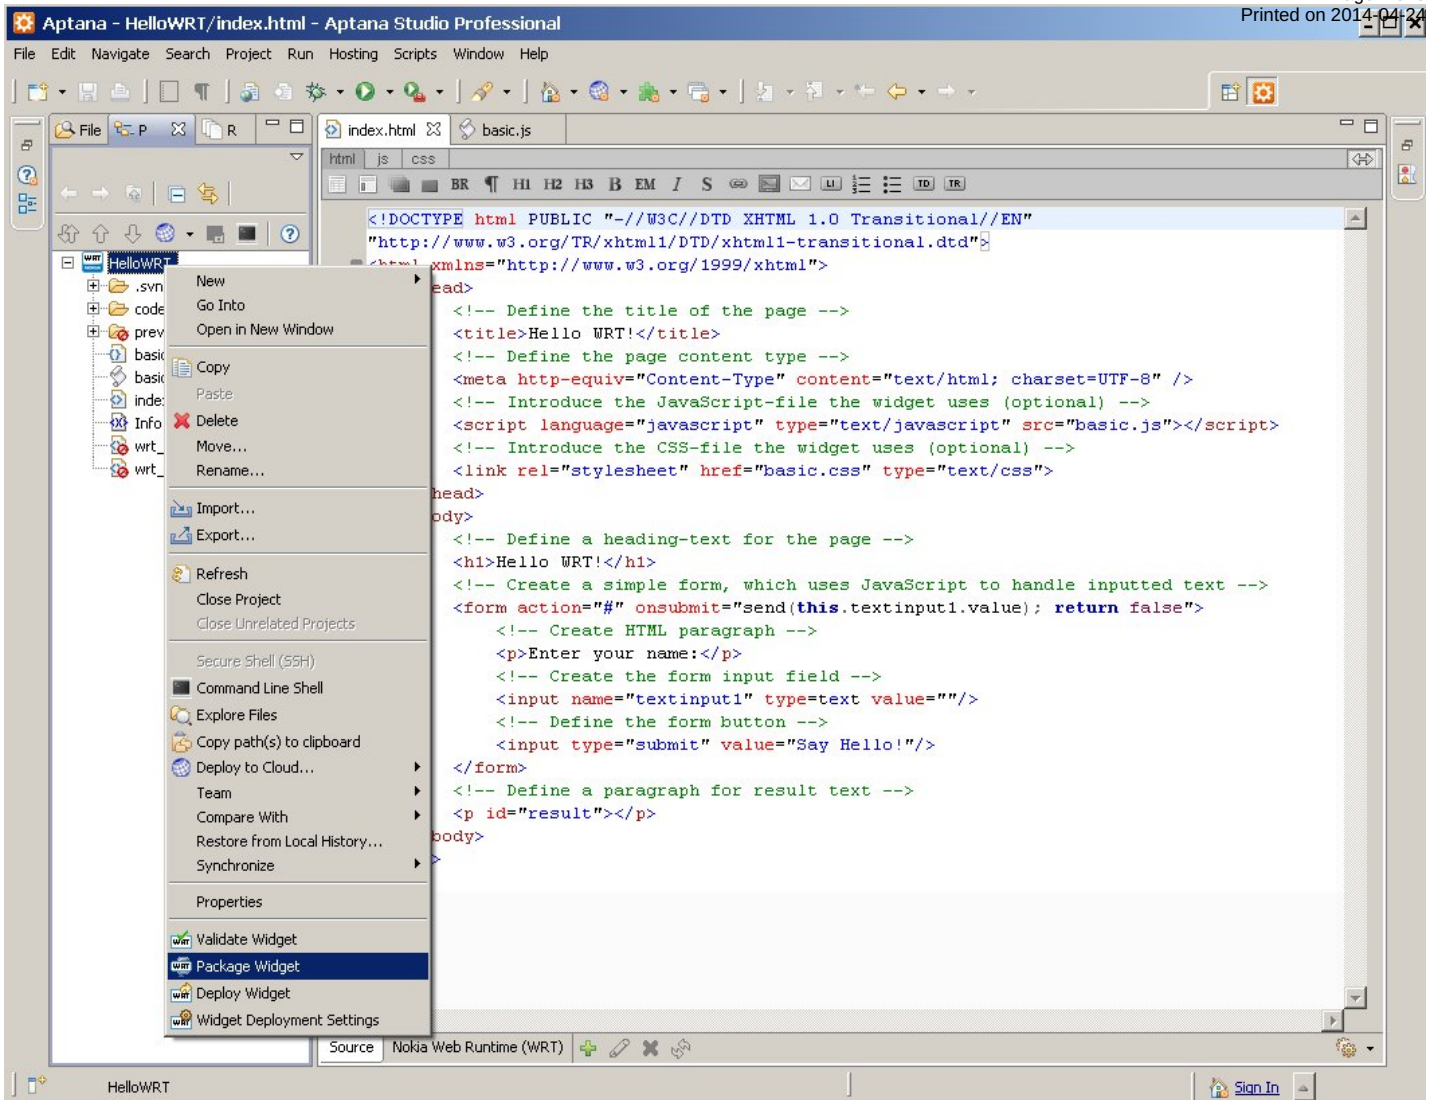

- Specify the names of HTML, CSS, and JavaScript files, or use the default names. Click Finish.

- The plug-in has now created the project for you with all the needed files for the WRT widget. You can copy the code of the "HelloWRT" widget created in the article [Create your first WRT widget](#) to the index.html, basic.js, and info.plist files, and paste them to the similar files created by Aptana.
- The Nokia WRT Plug-in has a preview possibility, so an SDK or a device is not necessarily needed to see what the widget looks like. When the index.html file has been selected, choose Nokia Web Runtime (WRT) from the bottom of the editor panel.

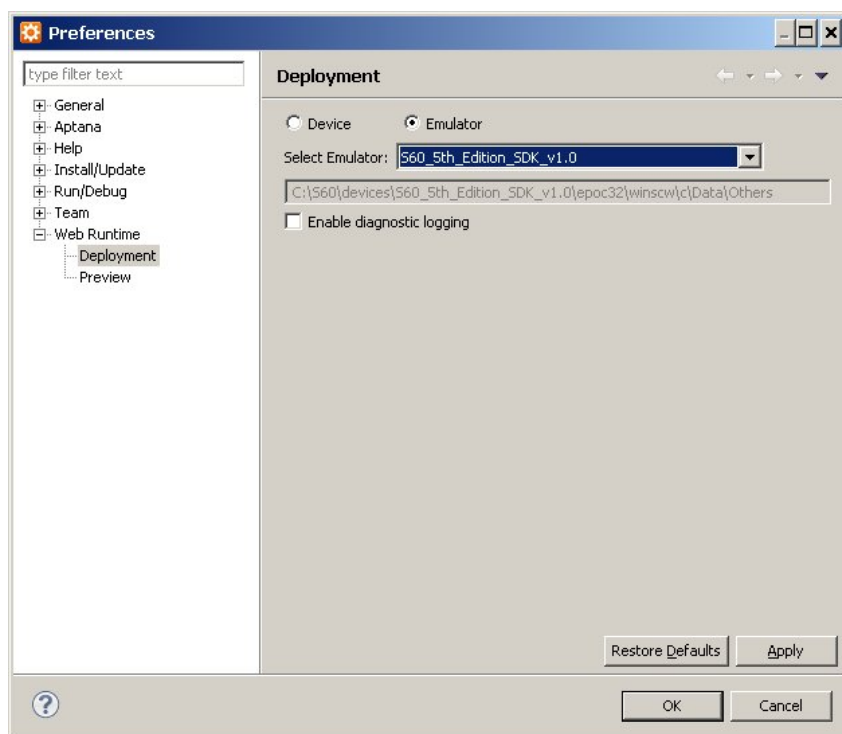

- To make a .wgz package in Aptana, right-click the mouse button over the project name in the project tree and select Package Widget.

- To run the widget in the device or an emulator, select Widget Deployment Settings.

- Next, choose either a device, which you have connected to your PC, or the SDK you have installed earlier.

- To deploy the widget, choose Deploy Widget.
