

## DrY Optionsbox

DrY Optionsbox component is loosely based on Guarana Button implementation, basically it implements both radio and check buttons as well as the container for these buttons in it.

Following code snippet shows how it can be used:

```
dojo.require("dry.Optionsbox");

var buttonData1 = [{
  title: "First",
  checked: true,
  id: "first item"
},{
  title: "Second",
  id: "2nd item"
},{
  title: "Third",
  id: "third item"
},{
  title: "Fourth",
  id: "last item"
}];

var radio = new dry.Optionsbox({title: "Radio", styleTweaker: styleTweaker, items:
buttonData1, type: 'radio', changed: valueChanged}, 'controlDiv1');

var check = new dry.Optionsbox({title: "Checkbox", styleTweaker: styleTweaker, items:
buttonData1, changed: valueChanged}, 'controlDiv2');
```

The constructor takes 2 items, where the second one is the name for the div where the Optionsbox is placed in. The first argument is a struct defining the Optionsbox properties and callback functions:

- title: title shown in the container,
- items: array of button definitions,
- type: either 'radio' or 'check',
- changed: callback called when selection is changed,
- styleTweaker: styleTweaker for handling the themes.
