

DrY Toggle and togglelist

DrY Toggle component is based on Nokia Web templates component, and the toggle list then is own implementation implementing a list having the toggle controls in it. Themes for the component are takes from Guarana and Theme roller.

Following code snipped shows on how a simple toggle control can be constructed:

```
dojo.require("dry.ToggleSwitch");

var tgle = new dry.ToggleSwitch({
  isOn: true,
  styleTweaker: styleTweaker,
  changed:ratingChanged,
  offText:"Off",
  onText:"on"}, '
controlDiv');
```

The constructor takes 2 items, where the last one is the name for the div where the toggle component is placed in and the first argument is a struct defining the properties fort he component:

- isOn: initial state fort he toggle true/false,
- changed: callback function for change events,
- offText: text fort he Off-State,
- onText: text fort he On-State,
- styleTweaker: styleTweaker for the themes.

And then following code snipped shows on how the toggle list can be used:

```
dojo.require("dry.ToggleList");

var toggleData = [
{
  toggle: {
    isOn: true,
    changed:ratingChanged,
    offText:"Off",
    onText:"on"
  },
  title: "On/Off me",
  togleid: "FirstToggle"
},{
  toggle: {
    isOn: true,
    changed:ratingChanged,
    offText:"10",
    onText:"100"
  },
  title: "Rate me",
  togleid: "SecondToggle"
},{
  toggle: {
    isOn: false,
    changed:ratingChanged,
    offText:"No",
    onText:"Yes"
  },
}
```

```
    title: "Cool ?",  
    toggleid: "ThirdToggle"  
  }];  
  
  var hw = new dry.ToggleList({  
    toggles:toggleData,  
    styleTweaker: styleTweaker,  
    destroyed:toggle
```

The constructor takes 2 items, where the last one is the name for the div where the toggle list component is placed in and the first argument is a struct defining the properties for the component:

- toggles: array of toggle control items,
- destroyed: callback function for the destroyed event,
- styleTweaker: styleTweaker for the themes.
