

Mobile Web Template

Introduction

A Web Template is a ready-made website that will allow you to create high-quality websites in a fraction of the time. Why web templates make sense in web design:

- Speed.
- Cost.

A web template turns a complex process into something simple:

1. The client selects the style they want from a collection of web templates.
 2. Once the client makes their choice, any half competent web designer can easily customize the template to the client's needs.
- There are many factors that you need to consider when it comes to choosing the right website template. The end product would mostly depend upon your ability to decide which type of these templates suit your purpose best. Your decision, in turn would be influenced by what type of audience you intend to attract.

Thus in this Wiki article we will try to collect various web templates.

Types

- Html Website Templates
- Flash Website Templates
- PSD website templates

Most Popular Categories

Here are few examples of most common web template.

Header Section

Title of web page enclosed in **<title>** tag. This section can have a javascript section enclosed in Example:**<script type="text/javascript">**
